

Air Conditioner Self-Diagnosis Check List

Oh no! It's the sweltering heat of summer and your air conditioner isn't cooling your home! What's your course of action? Homes can become dangerously warm in the midwest without AC. In the case of an emergency we've compiled a check list you can run through before you call a professional.

- Furnace Filter**
 - Check that your furnace filter is clean and in the proper position.

- Thermostat**
 - Check that your thermostat has power and is set to 'cool'.

- Vents**
 - Check that the vents are open and unobstructed

- Breaker Box**
 - Check that the AC breaker is flipped on.

- AC Cover**
 - If you cover your AC unit during the off season, make sure the cover is off.

- Access Panel**
 - Check that the access panel is properly secured.
 - Some systems won't work if the access panel isn't secure.

If you are still without AC, give the pros at Aquarius a call!
